

FUTURE LENS
PLAN 1: MSDEC

OVERVIEW

The Metacognitive Data Evaluation Cycle (MSDEC) is a data-driven framework that optimizes **workflow** by evaluating self-collected, routine **data**, designing an **improvement plan (IP)**, and **test-driving** the plan. Its purpose is to maximize a repeated **area's** efficiency and effectiveness by leveraging each **session's** successes, challenges, and observations as data to improve for the next iteration.

STEPS

1	Collect	To report your workflow as data that can be evaluated, particularly steps in the process that deviate from a specified goal.
2	Evaluate	To identify the variable in a chain of events that cause a particular outcome.
3	Design	To develop an improvement that advances one toward a goal based on the identified variable(s) during evaluation .

		To adjust one's environment, procedures, and schedule to create an improvement plan (IP) for implementation of the improvement.
4	Test Drive	To trial run the improvement plan (IP) for potential repetition of the cycle.
